the drug. (5.2)

less than or equal to 60 mL/min. (2.3)

\*\*Intramuscular route of administration is indicated only for mild to moderate, uncomplicated or complicated UTIs due to E. coli. (2.1)

Pediatric Patients (2 months to 16 years)\_ Recommended dosage in pediatric with CrCL greater than 60 mL/min.

The usual recommended dosage in pediatric patients is 50 mg per

kg per dose administered every 12 hours (every 8 hours for febrile

Patients with Renal Impairment: Adjust dose in patients with CrCL

-- DOSAGE FORMS AND STRENGTHS --

Cefepime for Injection, USP is a sterile powder of cefepime in single-dose vials for reconstitution, available in the following strengths:

----CONTRAINDICATIONS--

Patients with known immediate hypersensitivity reactions to cefepime

or other cephalosporins, penicillins or other beta-lactam antibacterial

- WARNINGS AND PRECAUTIONS -

Hypersensitivity Reactions: Cross-hypersensitivity among beta-

lactam antibacterial drugs may occur in up to 10% of patients with a history of penicillin allergy. If an allergic reaction to

Neurotoxicity: May occur especially in patients with renal impairment administered unadjusted doses. If neurotoxicity

associated with cefepime for injection therapy occurs, discontinue

Clostridioides difficile-Associated Diarrhea (CDAD): Evaluate if

--- ADVERSE REACTIONS --The most common adverse reactions (incidence ≥ 1%) were local reactions, positive Coombs' test, decreased phosphorous, local reactions, positive Coolinis test, decreased phospinorous, increased ALT and AST, increased PT and PTT and rash. (6.1)
At the highest dose (2 g every 8 hours), incidence of adverse reactions was ≥ 1% for rash, diarrhea, nausea, vomiting, pruritus, fever, and headache. (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact Fresenius Kabi USA, LLC at 1-800-551-7176 or FDA at 1-800-FDA-1088 or www.

- DRUG INTERACTIONS -Aminoglycosides: increased potential of nephrotoxicity and ototoxicity. Monitor renal function. (7.2)

Diuretics: nephrotoxicity has been reported following concomitant

-- USE IN SPECIFIC POPULATIONS -

Geriatric Use: Serious neurologic adverse reactions have occurred in geriatric patients with renal insufficiency given unadjusted

Revised: 03/2022

ministration of other cephalosporins with potent diuretics such

cefepime for injection occurs, discontinue the drug. (5.1)

# CEFEPIME for injection, for intravenous or intramuscular use

## Initial U.S. Approval: 1996

--- INDICATIONS AND USAGE ---Cefepime for injection is a cephalosporin antibacterial indicated for the treatment of the following infections caused by susceptible strains of

- the designated microorganisms neumonia. (1.1)
- Empiric therapy for febrile neutropenic patients. (1.2) Uncomplicated and complicated urinary tract infections (including pyelonephritis). (1.3)
- Uncomplicated skin and skin structure infections, (1.4) Complicated intra-abdominal infections (used in combination with metronidazole) in adults. (1.5)

To reduce the development of drug-resistant bacteria and maintain the effectiveness of cefepime for injection and other antibacterial drugs, cefepime for injection should be used only to treat or prevent infections that are proven or strongly suspected to be caused by bacteria. (1.6)

# ----- DOSAGE AND ADMINISTRATION ---

Recommended Dosage in Adults with Creatinine Clearance (CrCL) Greater Than 60 mL/min (2.1)

Site and Type of Infection	Dose	Frequency	Duration (days)
Moderate to Severe Pneumonia§	1 to 2 g IV	Every 8 to 12 hours	10
Empiric Therapy for Febrile Neutropenic Patients	2 g IV	Every 8 hours	7*
Mild to Moderate Uncomplicated or Complicated Urinary Tract Infections	0.5 to 1 g	Every 12 hours	7 to 10
Severe Uncomplicated or Complicated Urinary Tract Infections	2 g IV	Every 12 hours	10
Moderate to Severe Uncomplicated Skin and Skin Structure Infections	2 g IV	Every 12 hours	10
Complicated Intra-abdominal Infections <sup>§</sup> (used in combination with metronidazole)	2 g IV	Every 12 hours	7 to 10

 $^{\S}For$  Pseudomonas aeruginosa, use 2 g IV every 8 hours. (2.1) \*Or until resolution of neutropenia. (2.1)

### FULL PRESCRIBING INFORMATION 1 INDICATIONS AND USAGE

# Cefepime for injection is indicated in the treatment of pneumonia (moderate to severe) caused by susceptible strains of Streptococcus pneumoniae.

sociated with concurrent bacteremia, Pseudomonas aeruginosa, Klebsiella pneumoniae, or Enterobacter species 1.2 Empiric Therapy for Febrile Neutropenic Patients Cefepime for injection as monotherapy is indicated for empiric treatment of febrile neutropenic patients. In patients at high risk for severe infection

# (including patients with a history of recent bone marrow transplantation, with hypotension at presentation, with an underlying hematologic malignancy

or with severe or prolonged neutropenia), antimicrobial monotherapy may not be appropriate. Insufficient data exist to support the efficacy of cefepin monotherapy in such patients [see Clinical Studies (14.1)]. 1.3 Uncomplicated and Complicated Urinary Tract Infections (including pyelonephritis)

# susceptible isolates of Escherichia coli or Klebsiella pneumoniae, when the infection is severe, or caused by Escherichia coli, Klebsiella pneumoniae

Cefepime for injection is indicated in the treatment of uncomplicated and complicated urinary tract infections (including pyelonephritis) caused by Proteus mirabilis, when the infection is mild to moderate, including cases associated with concurrent bacteremia with these bacteria 1.4 Uncomplicated Skin and Skin Structure Infections

# Cefepime for injection is indicated in the treatment of uncomplicated skin and skin structure infections caused by Staphylococcus aureus (methicillin-

1.5 Complicated Intra-abdominal Infections (used in combination with metronidazole)

### Cefepime for injection is indicated in the treatment of complicated intra-abdominal infections (used in combination with metronidazole) in adults caused by susceptible isolates of Escherichia coli, viridans group streptococci, Pseudomonas aeruginosa, Klebsiella pneumoniae, Enterobacter species, or cteroides fragilis [see Clinical Studies (14.2)].

1.6 Usage To reduce the development of drug-resistant bacteria and maintain the effectiveness of cefepime for injection and other antibacterial drugs, cefepime for injection should be used only to treat or prevent infections that are proven or strongly suspected to be caused by susceptible bacteria. When culture and susceptibility information are available, they should be considered in selecting or modifying antibacterial therapy. In the absence of such data, local

epidemiology and susceptibility patterns may contribute to the empiric selection of therapy.

2.1 Dosage for Adults
The recommended adult dosages and routes of administration are outlined in Table 1 below for patients with creatinine clearance greater than

# mended Dosage Schedule for Cefepime for Injection in Adult Patients with Creatinine Clearance (CrCL) Greater Than 60 mL/min

Site and Type of Infection	Dose	Frequency	(days)
Adults	Intravenous (IV)/ Intramuscular (IM)		
Moderate to Severe Pneumonia <sup>§</sup>	1 to 2 g IV	Every 8 to 12 hours	10
Empiric therapy for febrile neutropenic patients	2 g IV	Every 8 hours	7*
Mild to Moderate Uncomplicated or Complicated Urinary Tract Infections, including pyelonephritis	0.5 to 1 g IV/IM**	Every 12 hours	7 to 10
Severe Uncomplicated or Complicated Urinary Tract Infections, including pyelonephritis	2 g IV	Every 12 hours	10
Moderate to Severe Uncomplicated Skin and Skin Structure Infections	2 g IV	Every 12 hours	10
Complicated Intra-abdominal Infections§ (used in combination with metronidazole)	2 g IV	Every 8 to 12 hours	7 to 10
*or until resolution of neutropenia. In patients whose fever re	esolves but who remain n	eutropenic for more than 7 da	ys, the need for continued

\*Intramuscular route of administration is indicated only for mild to moderate, uncomplicated or complicated UTIs due to E. coli. §For P. aeruginosa, use 2 g IV every 8 hours

2.2 Pediatric Patients (2 months up to 16 years) The maximum dose for pediatric patients should not exceed the recommended adult dose.

### The usual recommended dosage in pediatric patients up to 40 kg in weight for durations as given above for adults is: 50 mg per kg per dose, administered every 12 hours for uncomplicated and complicated urinary tract infections (including

antimicrobial therapy should be re-evaluated frequently.

pyelonephritis), uncomplicated skin and skin structure infections, and pneumonia (see below). For moderate to severe pneumonia due to *P. aeruginosa* give 50 mg per kg per dose, every 8 hours

60 mL/min. Administer cefepime for injection intravenously over approximately 30 minutes.

50 mg per kg per dose, every 8 hours for febrile neutropenic patients.

# 2.3 Dosage Adjustments in Patients with Renal Impairment Adjust the dose of cefepime for injection in patients with creatinine clearance less than or equal to 60 mL/min to compensate for the slower rate

### of renal elimination. In these patients, the recommended initial dose of cefepime for injection should be the same as in patients with CrCL greater than 60 mL/min except in patients undergoing hemodialysis. The recommended doses of cefepime for injection in patients with renal impatients with renal impatients.

are presented in Table 2. When only serum creatinine is available, the following formula (Cockcroft and Gault equation)1 may be used to estimate creatinine clearance. The serum creatinine should represent a steady state of renal function

Males: Creatinine Clearance (mL/min) =Weight (kg) x (140 - age) 72 x serum creatinine (mg/dL)

Females: 0.85 x above value Table 2: Recommended Dosing Schedule for Cefepime for Injection in Adult Patients with Creatinine Clearance Less Than or Equal to 60 mL/min

500 mg every

Creatinine Clearance (mL/min)

emodialysis* 1 g on day 1, then 500 mg every 24 hours thereafter			1 g every 24 hours	
Continuous Ambulatory Peritoneal Dialysis (CAPD)	500 mg every 48 hours	1 g every 48 hours	2 g every 48 hours	2 g every 48 hours
Less than 11	250 mg every	250 mg every	500 mg every	1 g every
	24 hours	24 hours	24 hours	24 hours
11 to 29	500 mg every	500 mg every	1 g every	2 g every
	24 hours	24 hours	24 hours	24 hours
30 to 60	500 mg every	1 g every	2 g every	2 g every
	24 hours	24 hours	24 hours	12 hours
Greater than 60	12 hours	12 hours	12 hours	8 hours

Recommended Maintenance Schedule

In patients undergoing Continuous Ambulatory Peritoneal Dialysis (CAPD), cefepime for injection may be administered at the recommended doses at a dosage interval of every 48 hours (see Table 2). In patients undergoing hemodialysis, approximately 68% of the total amount of cefepime present in the body at the start of dialysis will be removed

during a 3-hour dialysis period. The dosage of cefepime for injection for hemodialysis patients is 1 g on Day 1 followed by 500 mg every 24 hours for the treatment of all infections except febrile neutropenia, which is 1 g every 24 hours. Cefepime for injection should be administered at the same time each day and following the completion of hemodialysis on hemodialysis days (see

patients [see Clinical Pharmacology (12.3)], changes in the dosing regimen proportional to those in adults (see Tables 1 and 2) are recommended for

time each day

Data in pediatric patients with impaired renal function are not available; however, since cefepime pharmacokinetics are similar in adults and pediatric

## 2.4 Prenaration of Cefenime for Injection for Intravenous Infusion

- Sterile Water for Injection
  - 0.9% Sodium Chloride Injection

  - - 5% Dextrose and 0.9% Sodium Chloride Injection
    - 5% and 10% Dextrose Injection M/6 Sodium Lactate Injection

  - Lactated Ringers and 5% Dextrose Injection

    Normosol®-R and Normosol®-M in 5% Dextrose Injection
  - Parenteral drugs should be inspected visually for particulate matter before administration. If particulate matter is evident in reconstituted fluids, the drug solution should be discarded.
  - Administer the resulting intravenous infusion over approximately 30 minutes.

    Intermittent intravenous infusion with a Y-type administration set can be accomplished with compatible solutions. However, during infusion of a
- solution containing cefepime, it is desirable to discontinue the other solution.

# 2.5 Preparation of Cefepime for Injection for Intramuscular Administration

Parenteral drugs should be inspected visually for particulate matter before administration. If particulate matter is evident in reconstituted fluids, the drug solution should be discarded

Single-Dose Vials for Intravenous (IV)/ Intramuscular (IM) Administration	Amount of Diluent to be added (mL)	Approximate Cefepime Concentration (mg/mL)	Amount of Reconstituted Volume to be Withdrawn (ml
Cefepime vial content			
1 g (IV)	10	100	10.5
1 g (IM)	2.4	280	3.6
2 g (IV)	10	160	12.5

### 2.6 Compatibility and Stability Intravenous Cefepime for Injection

Cefepime for injection vials are compatible at concentrations between 1 mg per mL and 40 mg per mL with the following intravenous infusion fluids: 0.9% Sodium Chloride Injection, 5% and 10% Dextrose Injection, M/6 Sodium Lactate Injection, 5% Dextrose and 0.9% Sodium Chloride Injection, Lactated Ringers and 5% Dextrose Injection, Normosol®-R, and Normosol®-M in 5% Dextrose Injection. These solutions may be stored up to 24 hours at controlled room temperature 20°C to 25°C (68°F to 77°F) or 7 days in a refrigerator 2°C to 8°C (36°F to 46°F).

# Admixture Compatibility

Cefepime for injection admixture compatibility information is summarized in Table 4. Table 4: Cefepime Admixture Stability

			Stability Time for		
Cefepime for Injection Concentration	Admixture and Concentration	Intravenous (IV) Infusion Solutions	RT/L (20°C to 25°C)	Refrigeration (2°C to 8°C)	
40 mg/mL	Amikacin 6 mg/mL	NS or D5W	24 hours	7 days	
40 mg/mL	Ampicillin 1 mg/mL	D5W	8 hours	8 hours	
40 mg/mL	Ampicillin 10 mg/mL	D5W	2 hours	8 hours	
40 mg/mL	Ampicillin 1 mg/mL	NS	24 hours	48 hours	
40 mg/mL	Ampicillin 10 mg/mL	NS	8 hours	48 hours	
4 mg/mL	Ampicillin 40 mg/mL	NS	8 hours	8 hours	
4 to 40 mg/mL	Clindamycin Phosphate 0.25 to 6 mg/mL	NS or D5W	24 hours	7 days	
4 mg/mL	Heparin 10 to 50 units/mL	NS or D5W	24 hours	7 days	
4 mg/mL	Potassium Chloride 10 to 40 mEq/L	NS or D5W	24 hours	7 days	
4 mg/mL	Theophylline 0.8 mg/mL	D5W	24 hours	7 days	
1 to 4 mg/mL	na	Aminosyn™ II 4.25% with electrolytes and calcium	8 hours	3 days	
0.125 to 0.25	na	Inpersol™ with 4.25% dextrose	24 hours	7 days	

NS = 0.9% Sodium Chloride Injection. D5W = 5% Dextrose Injection. na = not applicable.

Cefepime for Injection Admixture Incompatibility

Do not add solutions of cefepime for injection to solutions of ampicillin at a concentration greater than 40 mg per mL, or to metronidazole, vancomycin, gentamicin, tobramycin, netilmicin sulfate, or aminophylline because of potential interaction. However, if concurrent therapy with cefepime for injection is indicated, each of these antibacterial drugs can be administered separately.

# Intramuscular Cefepime for Injection Cefepime for injection constituted as directed is stable for 24 hours at controlled room temperature 20°C to 25°C (68°F to 77°F) or for 7 days in a refrigerator 2°C to 8°C (36°F to 46°F) with the following diluents: Sterile Water for Injection, 0.9% Sodium Chloride Injection, 5% Dextrose Injection, Sterile eriostatic Water for Injection with Parabens or Benzyl Alcohol, or 0.5% or 1% Lidocaine Hydrochloride.

Intramuscular and Intravenous Cefepime for Injection
As with other cephalosporins, the color of cefepime for injection powder, as well as its solutions tend to darken depending on storage conditions;

## however, when stored as recommended, the product potency is not adversely affected. **3 DOSAGE FORMS AND STRENGTHS**

Cefepime for Injection, USP is a sterile white to pale yellow powder of cefepime in single-dose vials and it is available in the following strengths: 1 gram per via 2 grams per vial

### 4 CONTRAINDICATIONS Cefepime for injection is contraindicated in patients who have shown immediate hypersensitivity reactions to cefepime or the cephalosporin class of antibacterial drugs, penicillins or other beta-lactam antibacterial drugs.

**5 WARNINGS AND PRECAUTIONS** 5.1 Hypersensitivity Reactions Before therapy with cefepime for injection is instituted, careful inquiry should be made to determine whether the patient has had previous immediate hypersensitivity reactions to cefepime, cephalosporins, penicillins, or other beta-lactams. Exercise caution if this product is to be given to penicillinsensitive patients because cross-hypersensitivity among beta-lactam antibacterial drugs has been clearly documented and may occur in up to 10%

# supportive measures.

of C. difficile.

Serious adverse reactions have been reported including life-threatening or fatal occurrences of the following: encephalopathy (disturbance of sness including confusion, hallucinations, stupor, and coma), aphasia, myoclonus, seizures, and nonconvulsive status epilepticus [see Adverse Reactions (6.2)]. Most cases occurred in patients with renal impairment who did not receive appropriate dosage adjustment. However, some cases of neurotoxicity occurred in patients receiving a dosage adjustment appropriate for their degree of renal impairment. In the majority of cases, symptoms of neurotoxicity were reversible and resolved after discontinuation of cefepime and/or after hemodialysis. If neurotoxicity associated with cefepime therapy

occurs, discontinue cefepime and institute appropriate supportive measures. 5.3 Clostridioides difficile-Associated Diarrhea Clostridioides difficile-associated diarrhea (CDAD) has been reported with use of nearly all antibacterial agents, including cefepime for injection, and may range in severity from mild diarrhea to fatal colitis. Treatment with antibacterial agents alters the normal flora of the colon leading to overgrowth

present with diarrhea following antibacterial drug use. Careful medical history is necessary since CDAD has been reported to occur over two months after the administration of antibacterial agents. If CDAD is suspected or confirmed, ongoing antibacterial drug use not directed against C. difficile may need to be discontinued. Appropriate fluid and electrolyte management, protein supplementation, antibacterial drug treatment of C. difficile, and surgical evaluation should be instituted as clinically indicated.

C. difficile produces toxins A and B, which contribute to the development of CDAD. Hypertoxin-producing strains of C. difficile cause incre and mortality, as these infections can be refractory to antimicrobial therapy and may require colectomy. CDAD must be considered in all patients who

### 5.4 Development of Drug-Resistant Bacteria Prescribing cefepime for injection in the absence of a proven or strongly suspected bacterial infection or a prophylactic indication is unlikely to provide enefit to the patient and increases the risk of the development of drug-resistant bacteria.

5.5 Drug/Laboratory Test Interactions

As with other antimicrobials, prolonged use of cefepime for injection may result in overgrowth of nonsusceptible microorganisms. Repeated evaluation of the patient's condition is essential. Should superinfection occur during therapy, appropriate measures should be taken

The administration of cefepime may result in a false-positive reaction for glucose in the urine when using some methods (e.g. Clinitest<sup>TM</sup> tablets) Isee Drug Interactions (7.1)].

Positive direct Coombs' tests have been reported during treatment with cefepime for injection. In patients who develop hemolytic anemia, discontinue the drug and institute appropriate therapy. Positive Coombs' test may be observed in newborns whose mothers have received cephalosporin

impairment, or poor nutritional state, as well as patients receiving a protracted course of antimicrobial therapy. Prothrombin time should be monitored

Urinary Glucose

Coombs' Tests

antibacterial drugs before parturition. Prothrombin Time Many cephalosporins, including cefepime, have been associated with a fall in prothrombin activity. Those at risk include patients with renal or hepatic

in patients at risk, and exogenous vitamin K administered as indicated. **6 ADVERSE REACTIONS** 

# The following adverse reactions are discussed in the Warnings and Precautions section and below Hypersensitivity Reactions [see Warnings and Precautions (5.1)]

Neurotoxicity (see Warnings and Precautions (5.2)]
Clostridioides difficile-Associated Diarrhea [see Warnings and Precautions (5.3)]

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in clinical trials of a drug cannot be directly

compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

In clinical trials using multiple doses of cefepime, 4,137 patients were treated with the recommended dosages of cefepime (500 mg to 2 g intravenous every 12 hours). There were no deaths or permanent disabilities thought related to drug toxicity. Sixty-four (1.5%) patients discontinued medication due to adverse reactions. Thirty-three (51%) of these 64 patients who discontinued therapy did so because of rash. The percentage of cefepime-treated

patients who discontinued study drug because of drug-related adverse reactions was similar at daily doses of 500 mg, 1 g, and 2 g every 12 hours (0.8%, 1.1%, and 2%, respectively). However, the incidence of discontinuation due to rash increased with the higher recommended doses. The following adverse reactions (Table 5) were identified in clinical trials conducted in North America (n=3,125 cefepime-treated patients) Table 5: Adverse Reactions in Cefepime Multiple-Dose Dosing Regimens Clinical Trials in North America Incidence equal to or greater than 1% Local adverse reactions (3%), including phlebitis (1.3%), pain and/or inflammation (0.6%)\*;

### rash (1.1%) Incidence less than 1% but greater than 0.1% Colitis (including pseudomembranous colitis), diarrhea, erythema, fever, headache, nausea, oral moniliasis, pruritus, urticaria, vaginitis, vomiting, anemia

consisted of rash (4%), diarrhea (3%), nausea (2%), vomiting (1%), pruritus (1%), fever (1%), and headache (1%). The following (Table 6) adverse laboratory changes, with cefepime, were seen during clinical trials conducted in North America.						
Table 6: Adverse Laboratory Changes in Cefepime Multiple-Dose Dosing Regimens Clinical Trials in North America						
Incidence equal to or greater than 1%	Positive Coombs' test (without hemolysis) (16.2%); decreased phosphorus (2.8%); increased					

At the higher dose of 2 g every 8 hours, the incidence of adverse reactions was higher among the 795 patients who received this dose of cefepime. They

Alanine Transaminase (ALT) (2.8%), Aspartate Transaminase (AST) (2.4%), eosinophils (1.7%); abnormal PTT (1.6%), Prothrombin Time (PT) (1.4%) Incidence less than 1% but greater than 0.1% Increased alkaline phosphatase, Blood Urea Nitrogen (BUN), calcium, creatinine, phosphorus,

### potassium, total bilirubin; decreased calcium\*, hematocrit, neutrophils, platelets, White Blood Cells (WBC)

\* Hypocalcemia was more common among elderly patients. Clinical consequences from changes in either calcium or phosphorus were not reported.

aphasia, myoclonus, seizures, and nonconvulsive status epilepticus have been reported (see Warnings and Precautions (5.2)).

## The following adverse reactions have been identified during post-approval use of cefepime for injection. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure. In addition to the adverse reactions reported during the North American clinical trials with cefepime, the following adverse reactions have been reported during worldwide postmarketing experience. Encephalopathy (disturbance of consciousness including confusion, hallucinations, stupor, and coma),

6.2 Postmarketing Experience

A similar safety profile was seen in clinical trials of pediatric patients.

Anaphylaxis including anaphylactic shock, transient leukopenia, neutropenia, agranulocytosis and thrombocytopenia, have been reported. 6.3 Cephalosporin-Class Adverse Reactions In addition to the adverse reactions listed above that have been observed in patients treated with cefepime, the following adverse reactions and altered laboratory tests have been reported for cephalosporin-class antibacterial drugs:

## Stevens-Johnson syndrome, erythema multiforme, toxic epidermal necrolysis, renal dysfunction, toxic nephropathy, aplastic anemia, hemolytic anem hemorrhage, hepatic dysfunction including cholestasis, and pancytopenia. 7 DRUG INTERACTIONS

7.1 Drug/Laboratory Test Interactions The administration of cefepime may result in a false-positive reaction for glucose in the urine with certain methods. It is recommended that glucose

tests based on enzymatic glucose oxidase reactions be used.

<u>Vials</u> Constitute the 1 gram, or 2 grams vial, of cefepime for injection with the one of the following diluents:

5% Dextrose Injection 0.5% or 1% Lidocaine Hydrochloride Injection

Sterile Bacteriostatic Water for Injection with Parabens or Benzyl Alcohol

0.9% Sodium Chloride Injection

Dilute the reconstituted solution with one of the following compatible infusion solutions prior to intravenous infusion (Refer to Table 3 below for the amount of diluent to be added to each vial and the amount of the reconstituted solution to be withdrawn):

Constitute cefepime for injection vials 1 gram and 2 grams with one of the following diluents: Sterile Water for Injection, 0.9% Sodium Chloride, 5% Dextrose Injection, 0.5% or 1% Lidocaine Hydrochloride, or Sterile Bacteriostatic Water for Injection with Parabens or Benzyl Alcohol. Refer to Table 3 below for the amount of diluent to be added to each vial and the amount of reconstituted volume to be withdrawn

Table 3: Preparation of Reconstituted Solutions of Cefepime for Injection

### 7.2 Aminoglycosides

Monitor renal function if aminoglycosides are to be administered with cefepime for injection because of the increased potential of nephrotoxicity and ototoxicity of aminoglycoside antibacterial drugs.

Nephrotoxicity has been reported following concomitant administration of other cephalosporins with potent diuretics such as furosemide. Monitor renal function when cefepime is concomitantly administered with potent diuretics

### 8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Risk Summary There are no cases of cefepime exposure during pregnancy reported from postmarketing experience or from clinical trials. Available data from published observational studies and case reports over several decades with cephalosporin use in pregnant women have not established drug-associated risks of

major birth defects, miscarriage or adverse maternal or fetal outcomes (*see Data*).

Cefepime was not associated with adverse developmental outcomes in rats, mice, or rabbits when administered parenterally during organogenesis. The doses used in these studies were 1.6 (rats), approximately equal to (mice), and 0.3 times (rabbits) the recommended maximum human dose (see Data). The estimated background risk of major birth defects and miscarriage for the indicated population is unknown. All pregnancies have a background risk of birth defect, loss, or other adverse outcomes. In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2% to 4% and 15% to 20%, respectively.

# <u>Data</u> *Human Data*

While available studies cannot definitively establish the absence of risk, published data from case-control studies and case reports over several decades have not identified an association with cephalosporin use during pregnancy and major birth defects, miscarriage, or other adverse maternal or fetal outcomes. Available studies have methodologic limitations, including small sample size, retrospective data collection, and inconsistent comparator groups.

Animal Data Cefepime was not embryocidal and did not cause fetal malformations when administered parenterally during the period of organogenesis to rats at doses up to 1000 mg/kg/day, to mice at doses up to 1200 mg/kg/day, or to rabbits at doses up to 100 mg/kg/day. These doses are 1.6 times (rats), approximately equal to (mice), and 0.3 times (rabbits) the maximum recommended clinical dose based on body surface area.

8.2 Lactation

## Risk Summary

Cefepime is present in human breast milk at low concentrations (approximately 0.5 mcg/mL) following a single intravenous dose of 1000 mg. A nursing infant consuming approximately 1000 mL of human milk per day would receive approximately 0.5 mg of cefepime per day (see Data). There is no information regarding the effects of cefepime on the breastfed infant or on milk production. The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for cefepime and any potential

adverse effects on the breastfed child from cefepime or from the underlying maternal condition

A pharmacokinetic study was conducted in 9 healthy lactating women to evaluate the concentrations of cefepime in plasma and breast milk following a single intravenous dose of 1000 mg. The mean breast milk concentrations of cefepime during the first 8 hours post-dose were approximately 0.5 mcg/mL and then declined and became undetectable between 12- and 24-hours post-dose. The mean cumulative breast milk excretion of cefepime over 24 hours was 0.01% of the administered dose. The pharmacokinetics of cefepime are similar between lactating and non-lactating women.

The safety and effectiveness of cefepime in the treatment of uncomplicated and complicated urinary tract infections (including pyelonephritis), uncomplicated skin and skin structure infections, pneumonia, and as empiric therapy for febrile neutropenic patients have been established in the age groups 2 months up to 16 years. Use of cefepime for injection in these age groups is supported by evidence from adequate and well-controlled studies of cefepime in adults with additional pharmacokinetic and safety data from pediatric trials [see Clinical Pharmacology (12.3)].

Safety and effectiveness in pediatric patients below the age of 2 months have not been established. There are insufficient clinical data to support the use of cefepime for injection in pediatric patients for the treatment of serious infections in the pediatric population where the suspected or proven pathogen is *H. influenzae* type b. In those patients in whom meningeal seeding from a distant infection site or in whom meningitis is suspected or documented, an alternate agent with demonstrated clinical efficacy in this setting should be used.

Of the more than 6,400 adults treated with cefepime for injection in clinical studies, 35% were 65 years or older while 16% were 75 years or older. When geriatric patients received the usual recommended adult dose, clinical efficacy and safety were comparable to clinical efficacy and safety in non-geriatric adult patients.

Serious adverse events have occurred in geriatric patients with renal insufficiency given unadjusted doses of cefepime, including life-threatening or fatal occurrences of the following: encephalopathy, myoclonus, and seizures [see Warnings and Precautions (5.2), Adverse Reactions (6.2)]. This drug is known to be substantially excreted by the kidney, and the risk of toxic reactions to this drug may be greater in patients with impaired renal function. Because elderly patients are more likely to have decreased renal function, care should be taken in dose selection, and renal function should be monitored [see Clinical Pharmacology (12.3), Warnings and Precautions (5.2), Dosage and Administration 2.3)].

# 8.6 Renal Impairment

Adjust the dose of cefepime for injection in patients with creatinine clearance less than or equal to 60 mL/min to compensate for the slower rate of renal elimination [see Dosage Adjustments in Patients with Renal Impairment (2.3)].

### 10 OVERDOSAGE

Patients who receive an overdose should be carefully observed and given supportive treatment. In the presence of renal insufficiency, hemodialysis, not peritoneal dialysis, is recommended to aid in the removal of cefepime from the body. Symptoms of overdose include encephalopathy (disturbance of consciousness including confusion, hallucinations, stupor, and coma), myoclonus, seizures, neuromuscular excitability, and nonconvulsive status epilepticus [see Warnings and Precautions (5.2), Adverse Reactions (6.2), Dosage and Administration (2.3)].

Cefepime for Injection, USP is a semi-synthetic, cephalosporin antibacterial for parenteral administration. The chemical name is 1-[[(6R,7R)-7-[2-(2-amino-4-thiazoly]-glyoxylamido]-2-carboxy-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-on-3-yl]methyl]-1-methylpyrrollidinii (2)-(0-methyloxime), monohydrochloride, monohydrate, which corresponds to the following structural formula:

Cefepime hydrochloride is a white to pale yellow powder. Cefepime hydrochloride contains the equivalent of not less than 825 mcg and not more than 911 mcg of cefepime  $(C_{i_0}H_{2d}N_0, S_2)$  per mg, calculated on an anhydrous basis. It is highly soluble in water. Cefepime for Injection, USP is supplied for intramuscular or intravenous administration in strengths equivalent to 1 g, and 2 g of cefepime. Cefepime for Injection, USP is a sterile, dry mixture of cefepime hydrochloride and L-arginine. The L-arginine, at an approximate concentration of 707 mg/g of

cefepime, is added to control the pH of the constituted solution at 4 to 6. Freshly constituted solutions of Cefepime for Injection, USP will range in color from pale yellow to ambe

# 12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

for cefepime has not been evaluated in patients.

Cefepime is a cephalosporin antibacterial drug [see Microbiology (12.4)].

## 12.2 Pharmacodynamics Similar to other beta-lactam antimicrobial agents, the time that the unbound plasma concentration of cefepime exceeds the MIC of the infecting organism has been shown to best correlate with efficacy in animal models of infection. However, the pharmacokinetic/pharmacodynamics relationship

12.3 Pharmacokinetics Pharmacokinetic parameters for cefepime in healthy adult male volunteers (n=9) following single 30-minute infusions (IV) of cefepime 500 mg, 1 g, and 2 g are summarized in Table 7. Elimination of cefepime is principally via renal excretion with an average (±SD) half-life of 2 (±0.3) hours and total body clearance of 120 (±8) mL/min in healthy volunteers. Cefepime pharmacokinetics are linear over the range 250 mg to 2 g. There is no evidence of

# Table 7: Mean Pharmacokinetic Parameters for Cefepime (±SD), Intravenous Administration

accumulation in healthy adult male volunteers (n=7) receiving clinically relevant doses for a period of 9 days

Cefepime for Injection				
Parameter	500 mg IV	1 g IV	2 g IV	
C <sub>max</sub> , mcg/mL	39.1 (3.5)	81.7 (5.1)	163.9 (25.3)

Number of subjects (male)	9	9	Q	

Pharmacokinetic parameters for cefepime following a single intramuscular injection are summarized in Table 8. The pharmacokinetics of cefepime are linear over the range of 500 mg to 2 g intramuscularly and do not vary with respect to treatment duration.

# ean Pharmacokinetic Parameters for Cefepime (±SD), Intramuscular Administration

Cefepime for Injection				
Parameter	500 mg IM	1 g IM	2 g IM	
C <sub>max</sub> , mcg/mL	13.9 (3.4)	29.6 (4.4)	57.5 (9.5)	
$T_{max},h$	1.4 (0.9)	1.6 (0.4)	1.5 (0.4)	
AUC, h∙mcg/mL	60 (8)	137 (11)	262 (23)	
Number of subjects (male)	6	6	12	

# **Absorption**

Following intramuscular (IM) administration, cefepime is completely absorbed.

## Distribution The average steady-state volume of distribution of cefepime is 18 (±2) L. The serum protein binding of cefepime is approximately 20% and is

independent of its concentration in serum Concentrations of cefepime achieved in specific tissues and body fluids are listed in Table 9.

Mean Time of Sample Post-

Table 9: Mean Concentrations of Cefepime in Specific Body Fluids (mcg/mL) or Tissues (mcg/g)

Tissue or Fluid	Route	# of Patients	Dose (h)	Mean Concentration
Blister Fluid	2 g IV	6	1.5	81.4 mcg/mL
Bronchial Mucosa	2 g IV	20	4.8	24.1 mcg/g
Sputum	2 g IV	5	4	7.4 mcg/mL
Urine	500 mg IV 1 g IV 2 g IV	8 12 12	0 to 4 0 to 4 0 to 4	292 mcg/mL 926 mcg/mL 3,120 mcg/mL
Bile	2 g IV	26	9.4	17.8 mcg/mL
Peritoneal Fluid	2 g IV	19	4.4	18.3 mcg/mL
Appendix	2 g IV	31	5.7	5.2 mcg/g
Gallbladder	2 g IV	38	8.9	11.9 mcg/g
Prostate	2 g IV	5	1	31.5 mcg/g

Metabolism and Excretion

Cefepime is metabolized to N-methylpyrrolidine (NMP) which is rapidly converted to the N-oxide (NMP-N-oxide). Urinary recovery of unchanged cefepime accounts for approximately 85% of the administered dose. Less than 1% of the administered dose is recovered from urine as NMP, 6.8% as NMP-N-oxide, and 2.5% as an epimer of cefepime. Because renal excretion is a significant pathway of elimination, patients with renal dysfunction and patients undergoing hemodialysis require dosage adjustment [see Dosage and Administration (2.3)].

Specific Population Patients with Renal impairment Cefepime pharmacokinetics have been investigated in patients with various degrees of renal impairment (n=30). The average half-life in patients requiring hemodialysis was 13.5 (±2.7) hours and in patients requiring continuous peritoneal dialysis was 19 (±2) hours. Cefepime total body clearance decreased proportionally with creatinine clearance in patients with abnormal renal function, which serves as the basis for dosage adjustment

# recommendations in this group of patients [see Dosage and Administration (2.3)].

Patients with Hepatic impairment The pharmacokinetics of cefepime were unaltered in patients with hepatic impairment who received a single 1 g dose (n=11).

# Cefepime pharmacokinetics have been investigated in elderly (65 years of age and older) men (n=12) and women (n=12) whose mean (SD) creatinine

clearance was 74 (±15) mL/min. There appeared to be a decrease in cefepime total body clearance as a function of creatinine clearance. Therefore, dosage administration of cefepime in the elderly should be adjusted as appropriate if the patient's creatinine clearance is 60 mL/min or less [see Dosage and Administration (2.3)]. Cefepime pharmacokinetics have been evaluated in pediatric patients from 2 months to 11 years of age following single and multiple doses on every 8 hours (n=29) and every 12 hours (n=13) schedules. Following a single intravenous dose, total body clearance and the steady-state volume of distribution

averaged 3.3 (±1) mL/min/kg and 0.3 (±0.1) L/kg, respectively. The urinary recovery of unchanged cefepime was 60.4 (±30.4)% of the administered dose, and the average renal clearance was 2 (±1.1) mL/min/kg. There were no significant effects of age or gender (25 male vs. 17 female) on total body clearance or volume of distribution, corrected for body weight. No accumulation was seen when cefepime was given at 50 mg per kg every 12 hours (n=13), while C<sub>max</sub>, AUC, and t<sub>1/2</sub> were increased about 15% at steady state after 50 mg per kg every 8 hours. The exposure to cefepime following a 50 mg per kg intravenous dose in a pediatric patient is comparable to that in an adult treated with a 2 g intravenous dose. The absolute bioavailability of cefepime after an intramuscular dose of 50 mg per kg was 82.3 (±15)% in eight patients.

12.4 Microbiology Mechanism of Action
Cefepime is a bactericidal drug that acts by inhibition of bacterial cell wall synthesis. Cefepime has a broad spectrum of in vitro activity that encompasses a wide range of Gram-positive and Gram-negative bacteria. Within bacterial cells, the molecular targets of cefepime are the penicillin binding proteins

Antimicrobial Activity
Cefepime has been shown to be active against most isolates of the following microorganisms, both in vitro and in clinical infections as described in the Indications and Usage section (1).

Gram-negative Bacteria Enterobacter spp Escherichia coli Klebsiella pneumoniae

Proteus mirabilis Pseudomonas aeruginosa

Staphylococcus aureus (methicillin-susceptible isolates only) Streptococcus pneumonia

Streptococcus pyogenes

Viridans group streptococci

The following in vitro data are available, but their clinical significance is unknown. At least 90 percent of the following bacteria exhibit an in vitro minimum inhibitory concentration (MIC) less than or equal to the susceptible breakpoint for cefepime against isolates of similar genus or organism group. However, the efficacy of cefepime in treating clinical infections due to these bacteria has not been established in adequate and well-controlled

Gram-nositive Racteria

Staphylococcus epidermidis (methicillin-susceptible isolates only) Staphylococcus saprophyticus

Streptococcus agalactiae

NOTE: Most isolates of enterococci, e.g., Enterococcus faecalis, and methicillin-resistant staphylococci are resistant to cefepime Gram-negative Bacteria

Acinetobacter calcoaceticus subsp. Iwoffii Citrobacter diversus

Citrobacter freundi Enterobacter agglomerans

Haemophilus influenzae Hafnia alvei Klebsiella oxytoca

Moraxella catarrhalis Morganella morganii

Proteus vulgaris

Providencia rettgeri Providencia stuartii

Serratia marcescens NOTE: Cefepime is inactive against many isolates of Stenotrophomonas maltophilia.

## Susceptibility Testing

For specific information regarding susceptibility test interpretive criteria and associated test methods and quality control standards recognized by FDA for this drug, please see: https://www.fda.gov/STIC.

### 13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

No animal carcinogenicity studies have been conducted with cefepime. In chromosomal aberration studies, cefepime was positive for clastogenicity in primary human lymphocytes, but negative in Chinese hamster ovary cells. In other *in vitro* assays (bacterial and mammalian cell mutation, DNA repair in primary rat hepatocytes, and sister chromatid exchange in human lymphocytes), cefepime was negative for genotoxic effects. Moreover, in vivo assessments of cefepime in mice (2 chromosomal aberration and 2 micronucleus studies) were negative for clastogenicity. No untoward effects on fertility were observed in rats when cefepime was administered subcutaneously at doses up to 1,000 mg/kg/day (1,6 times the recommended maximum human dose based on body surface area).

14 CLINICAL STUDIES

14.1 Febrile Neutropenic Patients The safety and efficacy of empiric cefepime monotherapy of febrile neutropenic patients have been assessed in two multicenter, randomized trials comparing defepine monotherapy (at a dose of 2 g intravenously every 8 hours) to ceftazidine monotherapy (at a dose of 2 g intravenously every 8 hours). These studies comprised 317 evaluable patients. Table 10 describes the characteristics of the evaluable patient population.

	Cefepime	Ceftazidime
Total	164	153
Median age (yr)	56 (range, 18 to 82)	55 (range, 16 to 84)
Male	86 (52%)	85 (56%)
Female	78 (48%)	68 (44%)
Leukemia	65 (40%)	52 (34%)
Other hematologic malignancies	43 (26%)	36 (24%)
Solid tumor	54 (33%)	56 (37%)
Median ANC nadir (cells/microliter)	20 (range, 0 to 500)	20 (range, 0 to 500)
Median duration of neutropenia (days)	6 (range, 0 to 39)	6 (range, 0 to 32)
Indwelling venous catheter	97 (59%)	86 (56%)
Prophylactic antibacterial drugs	62 (38%)	64 (42%)
Bone marrow graft	9 (5%)	7 (5%)

ANC = absolute neutrophil count; SBP = systolic blood pressure

SBP less than 90 mm Hg at entry

Table 11 describes the clinical response rates observed. For all outcome measures, cefepime was therapeutically equivalent to ceftazidime

7 (4%)

2 (1%)

## Table 11: Pooled Response Rates for Empiric Therapy of Febrile Neutropenic Patients

	% Response Cefepime	Ceftazidime
Outcome Measures	(n=164)	(n=153)
Primary episode resolved with no treatment modification, no new febrile episodes or infection, and oral antibacterial drugs allowed for completion of treatment	51	55
Primary episode resolved with no treatment modification, no new febrile episodes or infection and no post-treatment oral antibacterial drugs	34	39
Survival, any treatment modification allowed	93	97
Primary episode resolved with no treatment modification and oral antibacterial drugs allowed for completion of treatment	62	67
Primary episode resolved with no treatment modification and no post-treatment oral	46	51

Insufficient data exist to support the efficacy of cefepime monotherapy in patients at high risk for severe infection (including patients with a history of recent bone marrow transplantation, with hypotension at presentation, with an underlying hematologic malignancy, or with severe or prolonged neutropenia). No data are available in patients with septic shock.

# 14.2 Complicated Intra-abdominal Infections

Patients hospitalized with complicated intra-abdominal infections participated in a randomized, double-blind, multicenter trial comparing the combination of cefepime (2 g every 12 hours) plus intravenous metronidazole (500 mg every 6 hours) versus imipenem/cilastatin (500 mg every 6 hours) for a maximum duration of 14 days of therapy. The study was designed to demonstrate equivalence of the two therapies. The primary analyses were conducted on the population consisting of those with a surgically confirmed complicated infection, at least one pathogen isolated pretreatment, at least 5 days of treatment, and a 4 to 6 week follow-up assessment for cured patients. Subjects in the imipenem/cilastatin arm had higher APACHE Il scores at baseline. The treatment groups were otherwise generally comparable with regard to their pretreatment characteristics. The overall clinical cure rate among the primary analysis patients was 81% (51 cured/63 evaluable patients) in the cefepime plus metronidazole group and 66% (62/94) in the imipenem/cilastatin group. The observed differences in efficacy may have been due to a greater proportion of patients with high APACHE II scores in the imipenem/cilastatin group.

## 16 HOW SUPPLIED/STORAGE AND HANDLING **How Supplied**

Cefepime for Injection, USP is supplied as follows

Cefepime for Injection, USP in the dry state, is a white to pale yellow powder. Constituted solution of Cefepime for Injection, USP can range in color from pale yellow to amber.

<b>Product Code</b>	Unit of Sale	Strength	Each
320620	NDC 63323-326-20 Unit of 10	1 gram* per vial	NDC 63323-326-21
324020	NDC 63323-340-20	2 grams* per vial	NDC 63323-340-21

\*Based on cefepime activity

# Storage and Handling

Cefepime for Injection, USP in the dry state should be stored at 20°C to 25°C (68°F to 77°F) [see USP Controlled Room Temperature]. Protect from light Retain in carton until time of use. Discard unused portion.

- Counsel patients that antibacterial drugs including cefepime for injection should only be used to treat bacterial infections. They do not treat viral infections (e.g., the common cold). When cefepime for injection is prescribed to treat a bacterial infection, patients should be told that although it is common to feel better early in the course of therapy, the medication should be taken exactly as directed. Skipping doses or not completing the full course of therapy may (1) decrease the effectiveness of the immediate treatment and (2) increase the likelihood that bacteria will develop resistance and will not be treatable by cefepime for injection or other antibacterial drugs in the future. Diarrhea is a common problem caused by antibacterial drugs, which usually ends when the antibacterial drug, is discontinued. Inform patient that
- they may develop watery and bloody stools (with or without stomach cramps and fever) during treatment and as late as two or more months after having taken the last dose of the antibacterial drug. Inform patients that they should contact their physician as soon as possible if this occurs. Advise patients of neurological adverse events that could occur with cefepime for injection use. Instruct patients or their caregivers to inform their healthcare provider at once of any neurological signs and symptoms, including encephalopathy (disturbance of consciousness including
- confusion, hallucinations, stupor, and coma), aphasia (disturbance of speaking and understanding spoken and written language), myoclonus, seizures and nonconvulsive status epilepticus, for immediate treatment, dosage adjustment, or discontinuation of cefepime for injection.
