WARNING

WARNING
It is recommended that dacarbazine be administered under the supervision of a qualified physician experienced in the use of cancer chemotherapeutic agents.

1. Hemopoietic depression is the most common toxicity with dacarbazine (see WARNINGS).

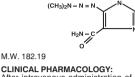

2. Hepatic necrosis has been reported (see WARNINGS).

3. Studies have demonstrated this agent to have a carcinogenic and teratogenic effect when used in animals.

4. In treatment of each patient, the physician must

- In treatment of each patient, the physician must weigh carefully the possibility of achieving therapeutic benefit against the risk of toxicity.

DESCRIPTION:
Dacarbazine for Injection, USP is a white to pale yellow colored solid which is light sensitive. Each vial contains 100 mg of dacarbazine, or 200 mg of dacarbazine (the active ingredient), citric acid and mannitol. Dacarbazine for Injection, USP is reconstituted and administered intravenously (pH 3-4). Dacarbazine for Injection, USP is an anticancer agent. Chemically, dacarbazine is 5-(3,3-Dimethyl-1-triazeno) imidazole-4-carboxamide with the following structural formula:

C₆H₁₀N₆O

M.W. 182.19 CeH10N6O

CLINICAL PHARMACOLOGY:
After intravenous administration of dacarbazine for injection, the volume of distribution exceeds total body water content suggesting localization in some body tissue, probably the liver. Its disappearance from the plasma is biphasic with initial half-life of 19 minutes and a terminal half-life of 5 hours.¹ In a patient with renal and hepatic dysfunctions, the half-lifes were lengthened to 55 minutes and 7.2 hours.¹ The average cumulative excretion of unchanged dacarbazine in the urine is 40% of the injected dose in 6 hours.¹ Dacarbazine is subject to renal tubular secretion rather than glomerular filtration. At therapeutic concentrations dacarbazine is not appreciably bound to human plasma protein. In man, dacarbazine for injection is extensively degraded. Besides unchanged dacarbazine, 5-amino-imidazole -4 carboxamide (AlC) is a major metabolite of dacarbazine excreted in the urine. AlC is not derived endogenously but from the injected dacarbazine, because the administration of radioactive dacarbazine labeled with 14C in the imidazole portion of the molecule (dacarbazine-2-14C) gives rise to AlC-2-14C.¹ Although the exact mechanism of action of dacarbazine is not known, three hypotheses have been offered: 1. inhibition of DNA synthesis by acting as a purine analog 2. action as an alkylating agent 3. interaction with SH groups

INDICATIONS AND USAGE:

INDICATIONS AND USAGE:
Dacarbazine for Injection is indicated in the treatment of metastatic malignant melanoma. In addition, Dacarbazine for Injection is also indicated for Hodgkin's disease as a second-line therapy when used in combination with other effective agents. CONTRAINDICATIONS: Dacarbazine for Injection is contraindicated in patients who have demonstrated a hypersensitivity to it in the

past. **WARNINGS:**

WARNINGS:
Hemopoietic depression is the most common toxicity with dacarbazine for injection and involves primarily the leukocytes and platelets, although, anemia may sometimes occur. Leukopenia and thrombocytopenia may be severe enough to cause death. The possible bone marrow depression requires careful monitoring of white blood cells, red blood cells, and platelet levels. Hemopoletic toxicity may warrant temporary suspension or cessation of therapy with dacarbazine for injection. Hepatic toxicity accompanied by hepatic vein thrombosis and hepatocellular necrosis resulting in death, has been reported. The incidence of such reactions has been low; approximately 0.01% of patients treated. This toxicity has been observed mostly when dacarbazine for injection has been administered concomitantly with other antineoplastic drugs; however, it has also been reported in some patients treated with dacarbazine for injection alone.

Anaphylaxis can occur following the administration of dacarbazine for injection.

PRECAUTIONS:
Hospitalization is not always necessary but adequate laboratory study capability must be available. Extravasation of the drug subcutaneously during intravenous administration may result in tissue damage and severe pain. Local pain, burning sensation, and irritation at the site of injection may be relieved by locally applied hot packs.

the site of injection may be relieved by locally applied hot packs.
Carcinogenicity of dacarbazine was studied in rats and mice. Proliferative endocardial lesions, including fibrosarcomas and sarcomas were induced by dacarbazine in rats. In mice, administration of dacarbazine resulted in the induction of angiosarcomas of the spleen.

spleen.

Pregnancy
Teratogenic Effects, Pregnancy Category C.
Dacarbazine has been shown to be teratogenic in rats
when given in doses 20 times the human daily dose on
day 12 of gestation. Dacarbazine when administered
in 10 times the human daily dose to male rats (twice
weekly for 9 weeks) did not affect the male libido,
although female rats mated to male rats had higher
incidence of resorptions than controls. In rabbits,
dacarbazine daily dose 7 times the human daily dose
given on Days 6-15 of gestation resulted in fetal skeletal
anomalies. There are no adequate and well controlled
studies in pregnant women. Dacarbazine should be
used during pregnancy only if the potential benefit
justifies the potential risk to the fetus.

It is not known whether this drug is excreted in human
milk. Because many drugs are excreted in human milk
and because of the potential for tumorigenicity shown
for dacarbazine in animal studies, a decision should be
made whether to discontinue nursing or to discontinue
the drug, taking into account the importance of the
drug to the mother.

may occur.

drug to the mother.

ADVERSE REACTIONS:
To report SUSPECTED ADVERSE REACTIONS, contact Fresenius Kabi USA, LLC at 1-800-551-7176 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch. Symptoms of anorexia, nausea, and vomiting are the most frequently noted of all toxic reactions. Over 90% of patients are affected with the initial few doses. The vomiting lasts 1-12 hours and is incompletely and unpredictably palliated with phenobarbital and/or prochlorperazine. Rarely, intractable nausea and vomiting have necessitated discontinuance of therapy with dacarbazine for injection. Rarely, dacarbazine has caused diarrhea. Some helpful suggestions include restricting the patient's oral intake of food for 4-6 hours prior to treatment. The rapid toleration of these symptoms suggests that a central nervous system mechanism may be involved, and usually these symptoms subside after the first 1 or 2 days.

There are a number of minor toxicities that are infrequently noted. Patients have experienced an influenzalike syndrome of fever to 39°C, myalgias and malaise. These symptoms occur usually after large single doses, may last for several days, and they may occur with successive treatments.

Alopecia has been noted as has facial flushing and successive treatments.

Alopecia has been noted as has facial flushing and facial paresthesia. There have been few reports of significant liver or renal function test abnormalities in man. However, these abnormalities have been observed more frequently in animal studies.

Erythematous and urticarial rashes have been observed infrequently after administration of dacarbazine for injection. Rarely, photosensitivity reactions may occur.

OVERDOSAGE:
Give supportive treatment and monitor blood cell counts. DOSAGE AND ADMINISTRATION:

Malignant Melanoma

The recommended dosage is 2 to 4.5 mg/kg/day for 10 days. Treatment may be repeated at 4 week intervals?

An alternate recommended dosage is 250 mg/square meter body surface/day I.V. for 5 days. Treatment may be repeated every 3 weeks^{3,4}

meter body surface/day I.V. for 5 days. Treatment may be repeated every 3 weeks 9.4

Hodgkin's Disease
The recommended dosage of Dacarbazine for Injection, USP in the treatment of Hodgkin's disease is 150 mg/square meter body surface/day for 5 days, in combination with other effective drugs. Treatment may be repeated every 4 weeks 5 An alternative recommended dosage is 375 mg/square meter body surface on day 1, in combination with other effective drugs, to be repeated every 15 days 5

Dacarbazine for Injection, USP 100 mg/vial and 200 mg/vial are reconstituted with 9.9 mL and 19.7 mL, respectively, of Sterile Water for Injection, USP. The resulting solution contains 10 mg/mL of dacarbazine having a pH of 3.0 to 4.0. The calculated dose of the resulting solution is drawn into a syringe and administered only intravenously.

The reconstituted solution may be further diluted with 5% Dextrose Injection or Sodium Chloride Injection and administered as an intravenous infusion.

After reconstitution and prior to use, the solution in the vial may be stored at 4°C for up to 72 hours or at normal room conditions (temperature and light) for up to 8 hours. If the reconstituted solution is further diluted in 5% Dextrose Injection or Sodium Chloride Injection, the resulting solution may be stored at 4°C for up to 24 hours or at normal room conditions for up to 8 hours. Procedures for proper handling and disposal of anticancer drugs should be considered. Several guidelines on this subject have been published. The procedures recommended in the guidelines are necessary or appropriate. Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration, whenever solution and container permit.

HOW SUPPLIED: DACARBAZINE FOR INJECTION, USP is available in the following forms

Strength

Each

NDC 63323-127-10 Unit of 10 100 mg NDC 63323-127-00 102710 10 mL Single Dose Vial NDC 63323-128-00 20 mL Single Dose Vial NDC 63323-128-20 Unit of 10 102820 200 mg STORE IN A REFRIGERATOR 2°-8°C (36°-46°F). PROTECT FROM LIGHT. USE WITHIN 8 HOURS OF RECONSTITUTION.

Vial stoppers do not contain natural rubber latex.
