SECTION 4: FIRST AID MEASURES

4.1. Description of First-aid Measures

General: Never give anything by mouth to an unconscious person. If you feel unwell, seek medical advice (show the label where possible). If product is biologically contaminated, follow all institutional protocols concerning the potential release of pathogens.

Inhalation: When symptoms occur: go into open air and ventilate suspected area. Obtain medical attention if breathing difficulty persists.

Skin Contact: Remove contaminated clothing. Wash with plenty of soap and water. Obtain medical attention if irritation develops or persists.

Eye Contact: Rinse cautiously with water for at least 5 minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Obtain medical attention if irritation develops or persists.

Ingestion: Rinse mouth. Do NOT induce vomiting. Obtain medical attention.

4.2. Most Important Symptoms and Effects Both Acute and Delayed

General: Not expected to present a significant hazard under anticipated conditions of normal use.

Inhalation: Prolonged exposure may cause irritation.

Skin Contact: Prolonged exposure may cause skin irritation.

Eye Contact: May cause slight irritation to eyes.

Ingestion: Ingestion may cause adverse effects.

Injection: Accidental injection may have adverse effects. Symptoms may include pain, redness, itching, or ulcerations at the injection site. Sequelae subsequent to accidental injection or in overdoses include hypotension, peripheral edema, flushing, diaphoresis, nausea, confusion, dizziness, headache, chest pain, seizure, weakness, somnolence and syncope.

Chronic Symptoms: None expected under normal conditions of use.

4.3. Indication of Any Immediate Medical Attention and Special Treatment Needed

If exposed or concerned, get medical advice and attention. If medical advice is needed, have product container or label at hand. Treatment should be based upon severity of presentation. Administration of calcium should be a first-line treatment in cases of overdosage or accidental injection, but is only partially effective at reversing calcium channel blockage. Glucagon may improve blood pressure but is generally not effective at restoring cardiac hemodynamics. Vasopressor therapy should always be considered, especially in severe cases. High-dose insulin may provide therapeutic benefits for cardiogenic shock seen in calcium-channel blockade. Intralipid infusion therapy should be considered in patients who are unresponsive to previous therapies including vasopressor therapy.
